Lead Broker Blueprint by Lorenzo Marietti

Module 7 deliverable

Validation Experiment Templates

Three small-budget experiments to test a vertical before committing

> **Use these templates before committing $10k+ to a vertical**
>
> Three patterns from Module 7.5. Each is a small, time-boxed experiment with a written decision rule. Spend $200-2,000, not $10-30,000, to find out whether the vertical works for you.
>
> Pick ONE pattern to run first (probably Pattern B — buyer-side conversations — for most newcomers). Run the others only if the first comes back positive.

Pattern A — Small-budget Google Ads test

Hypothesis

Write a specific, testable hypothesis. Format: "At $X per lead, I can produce [vertical] leads in [geography] that meet [specifications], at a rate of N+ per week."

Setup

Vertical / sub-vertical _____

Geography (zip / city / metro) _____

Target lead specifications _____

Target sale price (USD) _____

Maximum CPL for hypothesis to hold (× 0.6 of sale price recommended)

_____

Budget and timeline

Total ad-spend budget _____

Start date _____

End date (no more than 30 days out) _____

Tracking

- Campaign-level CPC, CTR, conversion rate.
- Lead-level: name, email, phone, time, qualification answers, source.
- Consent capture: TrustedForm or Jornaya certificate URL per lead.

Decision rule (write before starting)

If average CPL at end-of-period is ≤ [target], proceed to Pattern B (buyer conversations) and small-batch delivery.

If CPL is 1-1.5x target, investigate the gap before proceeding.

If CPL is more than 1.5x target, stop the experiment. The math doesn't work in this configuration.

Result (fill at end of experiment)

Pattern B — Buyer-side validation through conversation

Hypothesis

Format: "In [vertical] and [geography], I can find at least 3 prospective buyers willing to evaluate a small sample batch at [target sale price]. The specifications they describe match what I can produce."

Setup

Vertical / sub-vertical _____

Geography _____

Target buyer profile (solo / mid-size / large)

_____

Target sale price (range) _____

Outreach plan

Use Module 4 buyer-side conversation scripts.

Outreach channel(s) _____

Target: number of conversations completed

_____

Timeline (typically 2-4 weeks) _____

Conversations log

Track each conversation: name, organization, date, current supplier(s), prices they cite, specs they describe, return policy, willingness to evaluate a sample.

Decision rule (write before starting)

If 3+ buyers verbally commit to evaluating a sample batch at within ±15% of target price, proceed to a $500-1,500 paid validation aimed at producing exactly those specifications.

If 0-2 buyers commit, investigate the gap before proceeding. (Wrong vertical? Wrong sub-segment? Wrong target price? Wrong outreach approach?)

Result (fill at end of experiment)

Pattern C — Manual lead production and evaluation

Hypothesis

Format: "I can manually generate 5-10 leads in [vertical] and [geography] that 2-3 prospective buyers will pay [target price] for."

Setup

Vertical / sub-vertical _____

Generation method (outbound, manual qualification, content, etc.)

_____

Number of leads to produce _____

Timeline (2-4 weeks) _____

Buyer commitments before producing

Confirm 2-3 prospective buyers will evaluate the sample. Write commitments here:

Production

Track each lead produced: method, date, qualification answers, consent capture (if any).

Delivery and evaluation

Track buyer feedback per delivered lead.

Decision rule (write before starting)

If at least one buyer is willing to pay close to target price for at least 50% of the delivered sample, the hypothesis is partially validated. Proceed to a larger paid experiment with tightened specs.

If no buyer pays, document the specific feedback. The vertical may still work with adjustments; the specifics will tell you.

Result (fill at end of experiment)

Standing disclosures

These templates are research-based aids. Customize them to your vertical, your specific buyer commitments, and your tooling. The course author is a curriculum builder; the templates draw on operator-published patterns and validation methodology (e.g., Lean Startup) generally.
